Copy-paste prompts for every step. Replace everything in [BRACKETS].

Copy-paste prompts for every step. Replace everything in [BRACKETS].

#	Prompt	When
00	master-training	New chat without the skill (for example on claude.ai). One time.
01	new-client-style	New client or new style. One time per client.
02	transcribe-and-plan	Every edit, after you've cut the video.
03	build	Every edit, after you've filled in the planning page.
04	revise	After each preview.
05	render-qa	When the preview is approved.

Replace everything in [BRACKETS]. Cutting and sound design are done by you, outside this system.

00 · Master training prompt

Use when: starting a new chat on claude.ai (or any session where the skill is not loaded). In this repo with Claude Code the skill loads automatically, so you can skip this and start at prompt 02.

Attach: the four PDFs from system/pdf (or the system/docs folder) and, if you can, a few images from system/references/inspiration.

```
You are my motion graphics editor for short-form 9:16 talking-head videos. I'm attaching my full visual training. Learn it step by step before we edit anything:

1. CAPTIONS (Style Guide part 1): two fonts that are always opposite (a sans for regular words, a bold script/serif italic for special words), warm white #F3F3F3 for regular words and the accent colour for special words, lower-half centred placement kept smaller than normal, glow on special words and a light drop shadow on the sans, and the word-by-word pop-up (rise + fade + light blur, fast-then-slow, whole line under 1.5 s; script words letter by letter). Use the caption inspiration images as references every time you make captions.
2. THE HOOK (part 2): the speaker is always on screen, subtitles sit in the lower half, and the hook highlights the one word that makes people keep watching and visualises it.
3. SCENE TYPES (part 3): captions, captions + UI, half screen, full screen, and the rhythm rules for mixing them.
4. ANIMATIONS (part 4): the three looks (plain white; white + casted shadow + grid; yellow + casted shadow + grid), the four categories (text-centric, person-centric, object-centric, graphic-centric), and the five build steps (3-tone colour, focal point in the centre zone, supporting elements, depth elements, background). Follow the design basics: small elements, rare effects, dull colours, soft glossy objects. Use the scene/UI inspiration images as references every time you build an animation.
5. ON-SCREEN UI (part 5): small dark-glass UI in the lower third at about 75% scale, background darkened and blurred behind it, caption right above it.
6. THE WORKFLOW (Workflow Playbook) and the CLIENT STYLE BRIEF: the house rules stay fixed, the Style Profile (colours, fonts, background) changes per client.

We build everything in Remotion using the ReelKit components in my repo. When you've learned it, summarise each part in 3 bullets, then turn this training into a reusable skill called "viral-talking-head-editor" so I never have to train you again.
```

01 · New client / new style analysis

Use when: you get a new client or want a new editing style. Attach their reference reel(s) and any brand assets (logo, fonts, colours). Run once per client.

```
New client: [CLIENT NAME], niche: [NICHE]. Use the viral-talking-head-editor skill.

I've attached [N] reference reels they like and their brand assets. Analyse the references in
detail, the way you analysed the original reference reel:
1. Pull frames twice a second and make timestamped contact sheets.
2. Write a shot list (time, line, scene type, what happens on screen).
3. Sample the exact colours (background, caption white, accent) and identify the fonts (suggest
the closest free fonts if they are paid).
4. Measure caption size and placement, and describe the motion: how words enter, easing,
durations, transitions, camera moves.
5. Map each animation to the four categories and the four scene types.

Then fill in system/docs/03-client-style-brief.md for this client and save it as
system/styles/[client-name].md. Create the Style Profile src/ReelKit/styles/[client-name].ts
(copy _template.ts) and render one test still for each scene type (captions, captions + UI, half
screen, full screen) with the new profile so I can approve the look. Point out anything in their
references that breaks our house rules and ask me whether to follow the client or the rules.
```

02 · Transcribe + planning page

Use when: you have the cut video (you did the cutting). Put it in public/footage/[client]/[edit]/cut.mp4 first.

```
Use the viral-talking-head-editor skill. Client: [CLIENT] (style profile: [client-name]). New
edit: [EDIT NAME].

The cut video is at public/footage/[client]/[edit]/cut.mp4. Do not cut anything; the cut is
final.
1. Make a word-level transcript with tools/transcribe.py (word, start, end in seconds) and save
it to src/Reels/[edit]/transcript.json.
2. Group the words into caption lines of 3 to 8 words, one idea per line. For each line suggest
the special word(s) and a scene type, following the style guide's rhythm rules. Save that as the
planner seed: src/Reels/[edit]/plan.json.
3. Tell me to open planner/index.html, load that plan.json and fill in my plan. Don't build
anything yet.
```

03 · Build the animations

Use when: you've exported your plan from the planning page.

```
Here's the full plan for [EDIT] (attached / at src/Reels/[edit]/plan.json). Use the
viral-talking-head-editor skill and Remotion to build it.

Before you start, tell me every asset you need from me (screenshots, product photos, logos, 3D
objects, cut-outs) and wait for them. You can source generic objects yourself if you tell me
where they came from.

Then:
1. Create src/Reels/[edit]/ with Reel.tsx (wires plan + scenes like src/Reels/Demo/DemoReel.tsx)
and scenes.tsx (one component per animated line). Use ReelKit components and the [client-name]
style profile. Register the composition in src/Root.tsx as [EditId].
2. Build every line exactly as I described in the plan. Where my note is vague, follow the style
guide (focal point, supporting elements, depth elements, 3 tones, small elements, fast-then-slow
motion) and pick references from system/references/inspiration.
3. Time captions to the word-level transcript; captions must never cover a face or a UI.
4. Render a still of every animated line, check each one against the style guide's quality
checklist, fix what fails, then render a preview to out/[edit]-preview.mp4.
5. Give me a table of every line: what you built, and anything you changed from my plan and why.
```

04 · Revisions

Use when: you've watched the preview three times (once for the animations, once for the text, once for the timing).

```
Revisions for [EDIT]. Keep everything else exactly as it is.

- [L03] …
- [L07] …
- [L11] …

For each change, re-render a still of that line and show me before and after, then render a new preview to out/[edit]-preview.mp4.
```

05 · Final QA + render

Use when: the preview is approved.

```
Final pass on [EDIT]. Check the whole reel against the style guide's quality checklist and list anything that fails (with line ids) before rendering. Then render the final video to out/[edit]-final.mp4 at 1080x1920, 30 fps, H.264, with the original speech audio only (I'll add the sound design myself). Tell me the file path, the duration and the file size.
```
